

Biological Decontamination Services

Biological decontamination is a critical process that requires technical expertise and careful execution. It is more than merely wiping down surface; decontaminating sensitive biological instruments and spaces necessitates thorough disinfection and equipment-specific cleaning methods.

Triumvirate Environmental's decontamination experts, Certified Industrial Hygienists (CIHs), and Registered Biosafety Professionals (RBPs) have decades of experience working with specialized biological environments, including tissue culture rooms, vivariums, and BSL1, -2, and -3 R&D and manufacturing spaces. We partner with our clients to understand, manage, and remove contamination in laboratories. With effective, thorough decontamination methods and high attention to detail, we can return any lab to normal operations quickly, with confidence that any problem has been sufficiently eliminated.

Decontamination Services

Our experienced team provides a wide range of services to support your site-specific needs. Areas of expertise include:

- Decontamination testing and certification protocols for various spaces:
  - Laboratories and clean rooms
  - Incubators and shaker tables
  - Cold rooms and refrigerators
  - Fume hoods
  - Biological safety cabinets (BSCs)
  - Animal care facilities and equipment
- Biological contamination investigations
- Mycoplasma decontamination
- Mold remediation
- Sampling and laboratory analysis
- Biosafety advisory services
  - Work process audits and risk assessments
  - Disinfection and biological inactivation program development
  - Institutional Biosafety Committee (IBC) and permitting support

Preventative Maintenance

Preventative measures can reduce research and production downtime and maintain the integrity of specimens and products. Our experts provide preventative cleaning and periodic testing to keep your biologics work environment safe, compliant, and healthy. We can proactively work with your personnel to develop an appropriate and thoughtful program to avoid unexpected contamination—as well as associated costs and disruptions.

Maintaining a clean environment and eliminating contamination are critical to biologics research and manufacturing. Our experts investigate, analyze, and thoroughly decontaminate sensitive biological areas to ensure clean, safe, and productive work conditions.
